Professional Vita

November 2007

Primary interests: Development and application of biostatistical and epidemiological methods for analysis of longitudinal health data obtained in support of decision making in a clinical or policy environment particularly in mental health and psychiatry. Special interests in the analysis of life-course development and the epidemiology of mental disorders including dementia. Development of statistical methodology for assessing health effects of preventive interventions and environmental exposures. Analysis of statistical problems arising from applying evidence-based medicine in a clinical environment. Analysis of statistical issues arising from applying developmental epidemiological models to the course of disease. Assessment of risks, adverse effects, and intervention effects related to environmental and occupational exposures on patients, workers and the general public. Focus on problems in which clinical course is critical, data is limited, uncertainty is complex, potential risk is large, models are primitive yet complex, and the biological mechanisms of the disease, exposures and interventions are poorly understood.
