# WATER INJECTION CALCULATIONS <br> 15 Oct. 1998 <br> SAE J-2051 

Basis agreed at the SAE meeting of 27 Aug. 1998:

- Water injection to be 5 times the amount required to saturate $70^{\circ} \mathrm{F}$ air at the test pressure ( 90 psig ), when flowing air at the test cycle rate ( 300 cpm ), to fill and empty twice the test chamber volumes, in a 4 hour period, once a day.

Equations for specific and relative humidity are:
$\gamma=(0.622) \mathrm{p}_{\mathrm{w}} / \mathrm{p}_{\mathrm{d}}$
Where: $\quad \gamma=$ specific humidity
$\phi=\gamma \mathrm{p}_{\mathrm{d}} /(0.622) \mathrm{p}_{\mathrm{s}}$

$$
\begin{align*}
& \phi=\text { relative humidity }  \tag{2}\\
& \mathrm{p}_{\mathrm{d}}=\text { partial pressure of dry air, abs } \\
& \mathrm{p}_{\mathrm{w}}=\text { partial pressure of water vapor, abs. } \\
& \mathrm{p}_{\mathrm{s}}=\text { saturation pressure of water vapor, abs. }
\end{align*}
$$

If water is to saturate the air, the relative humidity is $100 \%$. Then, $\phi=1.00$ and
equation (2) becomes:

$$
(0.622) p_{\mathrm{s}}=\gamma \mathrm{p}_{\mathrm{d}}
$$

equation (1) becomes:

$$
(0.622) \mathrm{p}_{\mathrm{w}}=\gamma \mathrm{p}_{\mathrm{d}}
$$

and $\quad \mathrm{p}_{\mathrm{s}}=\mathrm{p}_{\mathrm{w}}$ at saturation.

From steam tables for saturation at $70^{\circ} \mathrm{F}$ :

$$
\mathrm{p}_{\mathrm{s}}=0.3631 \mathrm{psia}=\mathrm{p}_{\mathrm{w}}
$$

From Dalton's law for partial pressures:

$$
\begin{aligned}
& \mathrm{p}=\mathrm{p}_{\mathrm{d}}+\mathrm{p}_{\mathrm{w}} \quad \text { where: } \mathrm{p}=\text { total pressure of the mixture, abs. } \\
& \mathrm{P}_{\mathrm{d}}=\mathrm{p}-\mathrm{p}_{\mathrm{w}}=(90 \text { psig }+14.696 \text { atmos. press })-0.3631=104.33 \mathrm{psia}=p_{d}
\end{aligned}
$$

Returning to equation (1):

$$
\begin{equation*}
\gamma=(0.622) \mathrm{p}_{\mathrm{w}} / \mathrm{p}_{\mathrm{d}}=(0.622)(0.3631) /(104.33)=0.002165 \# \mathrm{H}_{2} \mathrm{O} / \# \text { dry air } \tag{3}
\end{equation*}
$$

From the perfect gas law: $\quad \mathrm{p} v=\mathrm{R} T \quad$ and $1 / \mathrm{v}=$ weight density
The weight density of dry air in the mixture is:

$$
\text { weight density }=\frac{p_{d}}{R T}=\frac{\left(104.33 \frac{\#}{\mathrm{in}^{2}}\right)\left(144 \frac{\mathrm{in}^{2}}{f t^{2}}\right)}{\left(53.34 \frac{\mathrm{ft}}{{ }^{\circ} R}\right)\left(529^{\circ} R\right)}=0.5324 \frac{\mathrm{\#} \mathrm{dry} \mathrm{air}}{f t^{3}}
$$

Combining this with equation (3), the amount of water vapor in the mixture is:

$$
(\mathrm{wv})=\left(0.002165 \# \mathrm{H}_{2} \mathrm{O} / \# \text { dry air }\right)\left(0.5324 \text { \# dry air } / \mathrm{ft}^{3}\right)=0.001153 \# \mathrm{H}_{2} \mathrm{O} / \mathrm{ft}^{3}
$$

(Note: For higher elevations where the atmospheric pressure is only 12.0 psia , the calculation for the amount of water vapor in the mixture results in the same value.)

The flow rate of the mixture is (one test chamber in each port, and twice each volume):

$$
\mathrm{Q}=2(2 \mathrm{~V} \mathrm{cc})(300 \mathrm{cpm}) \quad \text { where: } \mathrm{V}=\text { volume of one test chamber }
$$

For the requirement of 5 times the saturation amount in 4 hours, the total amount of water injected becomes:
$\mathrm{W}=\frac{5(\mathrm{wv}) \mathrm{Qt}}{(\text { density of water })}=5\left(0.001153 \frac{\# \mathrm{H}_{2} \mathrm{O}}{\mathrm{ft}^{3}}\right)(4 \mathrm{~V} \mathrm{cc})\left(300 \frac{\text { cycles }}{\mathrm{min}}\right)(4 \mathrm{hr})\left(\frac{1 \mathrm{ft}^{3}}{62.4 \#}\right)\left(\frac{60 \mathrm{~min}}{1 \mathrm{hr}}\right)\left(\frac{1 \text { litre }}{1000 \mathrm{cc}}\right)$
$\mathrm{W}=(0.0266)(\mathrm{V})$ liters $\quad$ where V is in cc units.

It is proposed to modify the test chamber volumes of table 5 in the present SAE standard by rounding off the metric volumes to Renard series values. Then a modified table 5, with new water quantities to be injected in a 4 hour period becomes:

| Automotive | ISO | Test Chamber Volume |  | Water Injected |
| :---: | :---: | :---: | :---: | :---: |
| Series | Series | cc | $\mathrm{in}^{3}$ | liters in 4 hrs. |
| 075 | 1 | 16 | $(0.98)$ | 0.5 |
| 125 | 2 | 50 | $(3.05)$ | 1.3 |
| 250 | 3 | 100 | $(6.10)$ | 2.7 |
| 500 | 4 | 200 | $(12.2)$ | 5.3 |
| 1000 |  | 320 | $(19.5)$ | 8.5 |
